These are the advancements i can add if i have more time

1) I will extract available commercial and residential strings from the given dataset after analyzing the data

2) I will use technique like Word2vec to create similar words to the words i extracted from the given dataset

3) I will create a lot of commercial and residential keywords using word2vec techniques

4) And then i can label the dataset and train it with a Large language model or any pretrained model/ any model for better performance
